PROGRAL COMMUNICATIONS COMMUNICATIONS OFFICE OF THE BECRETARY

RE:

CC Docket No. 96-262; Access Charge Reform

CC Docket No. 94-14 Price Cap Performance Review for

Local Exchange Carriers

CC Docket No. 97-250: MCI Telecommunications Corp. Emergency

Petition for Prescription of Access Charges

RM-9210: Consumer Federal of America Petition for Rulemaking

Dear Ms. Salas:

On January 27, 1999, Jim Hannon, John Kure and the undersigned, representing U S WEST, met with Tamara Preiss, Steve Spaeth, Aaron Goldschmidt, Florence Setzer and John Scott of the Competitive Pricing Division regarding the above-captioned proceedings. The attached documents served as the basis for the discussion.

In accordance with Section 1.1206(a)(2) of the Commission's rules, an original and one copy of this letter and the attachments are being filed with your office for inclusion in the record of this proceeding. Because of the late hour of our meeting yesterday, this ex parte notification is being filed with you today.

Acknowledgment and date of receipt of this submission is requested. A duplicate of this letter is provided for this purpose.

Sincerely,

U S WEST High Capacity Forbearance Market Share Update

PROGRAL COLUMNICATIONS COMMISSION
OFFICE OF THE SECRETARY

The market share information provided in the petitions for Phoenix and Seattle were based on a study as of the fourth quarter, 1997. Quality Strategies has completed new studies for the second quarter, 1998. The market shares of U S WEST Communications continue to erode.

	Provider	Transport	Retail	Wholesale	Overall
Fourth Quarter	1997	-			
Phoenix	71.7%	84.1%	29.2%	79.1%	77.4%
Seattle	65.2%	74.2%	20.7%	71.7%	72.8%
Second Quarter	1998				
Phoenix	69.5%	62.3%	27.9%	64.9%	67.1%
Seattle	64.7%	63.3%	20.0%	65.7%	64.2%

The overall High Capacity market share dropped noticeably in both cities, primarily driven by a significant decrease in the Transport segment. The Transport segment represents the purchases by carriers to extend their own backbone routes. This is further indication that the self-provisioning by the carriers is continuing, particularly in light of the merger of AT&T and TCG and the merger of MCI, MFS and WorldCom.

U S WEST High Capacity Forbearance Price Cap and Earnings Adjustments

This paper addresses the impacts to Price Caps and earnings when the FCC approves the U S WEST Communication petitions for forbearance for High Capacity Services. As demonstrated in the paper, the Price Cap mechanism is self-correcting and no adjustments are needed other than removing the demand for the affected services. From an earnings perspective the only impact is on the Low End Adjustment. The paper describes how the Adjustment would be apportioned to Price Cap services as well as to non-dominant services. Customers of Price Caps services are more than adequately protected when this process is used to effect a Low End Adjustment.

Price Caps will be adjusted by removing High Capacity Services. These services are in the Trunking Basket. The Trunking Price Cap Index and the Actual Price Index will be self-corrected by removing the demand counts from the base period demand in a TRP filing. The bands for the high capacity categories and subcategories would be adjusted in the same manner.

No exogenous treatment or freezing of the head room (i.e., the difference between the PCI and API) is necessary to protect other customers nor is it justified under Price Cap regulation. As demonstrated by the following analysis, the Price Cap mechanism is self-correcting. Removing one group of services such as high capacity services does not adversely impact other services. The total revenue (the "R" value) is automatically reduced by the value of the demand being removed. The amount of headroom shrinks proportionally. The example used in the analysis shows the headroom shrinking from \$5,432,616 to \$5,164,684. Because the headroom associated with the non-dominant services is removed it is not available to increase prices for the services remaining under Price Caps. In contrast, if these competitive services were to remain under Price Cap the extra headroom generated from competitively pricing these services would be available to raise prices to customers of other services in the Trunking Basket. The bands for the categories and subcategories are also automatically adjusted in a similar manner.

The only practical implication of earnings for a Price Cap company is the Low End Adjustment when the actual rate-of-return falls below 10.25%. As described later in this paper, the Low End Adjustment for Price Cap services would be reduced by the difference between the revenue generated from the non-dominant services compared to a theoretical revenue for these services. The theoretical revenue is calculated by repricing the non-dominant services at the corresponding rates on an average basis for each type of service (e.g., DS1). The remaining Low End Adjustment is then spread proportional to the actual revenues for the Price Cap and non-dominant services. In the example used in the analysis, an interstate Low End Adjustment of \$21M is reduced to \$10M for Price Cap services, the remainder of the adjustment is essentially assigned to the non-dominant services. This procedure protects the customers of Price Cap services from having to bear the burden of the full Low End Adjustment by assigning a portion to the non-dominant services.

When granting U S WEST's petition for forbearance, the Commission has the full authority to allow U S WEST to remove high capacity services from Price Cap regulation as described above

1/27/99

without additional changes in its rules. Section 10 gives the Commission the necessary authority to grant this relief.

Price Cap Plan

When U S WEST's forbearance petition for High Capacity Services is approved, Price Cap data will be changed in a TRP filing to show the effects of removing the demand no long subject to Price Caps. The TRP filing will not include any rate changes. The High Capacity Services are in the Trunking basket. To reflect the impacts to Price Caps from this demand reduction, this TRP filing is considered to be an update to the Price Cap Index for the Trunking basket. Using Price Cap rules in Part 61, the Price Cap Index (PCI) for the Trunking Basket is

$$PCI_{t-1} = PCI_{t-1} \bullet [1 + w \bullet (GDP-PI - X) + \Delta Y / R + \Delta Z / R]$$

Because this is not an Annual Filing, the inflation (GDP-PI) and the productivity (X) factors do not apply and are set to zero. Also exogenous changes (ΔZ) are not applicable as discussed below. The imputation of access charges (ΔY) is also not applicable. Both of these elements are set to zero. Even though it has no affect in the calculation of the PCI, the base period revenue (R) is the sum of base period demand reduced for the non-dominant demand (D_{iR}) multiplied by the rates (P_{it-1}) at the last PCI update. The net result is a new Price Cap Index equal to the former one.

$$PCI_{t-1} = PCI_{t-1} = 0.555254^{1}$$

The Actual Price Index (API) is then calculated

$$API_{t} = API_{t-1} \bullet \Sigma [v_{i} \bullet (P_{it} / P_{it-1})]$$

For this TRP filing the formula can be restated as

$$API_{t} = API_{t-1} \bullet \Sigma(D_{iR} \bullet P_{it}) / \Sigma(D_{iR} \bullet P_{it-1})$$

Because there are no rate changes there is no change in the API.

$$API_{t} = API_{t-1} = 0.551520$$

Headroom (HR) is the difference between the revenue generated from the actual prices and the revenue which is allowed if the API is equal to the PCI as permitted in the rules. The generally used formula for headroom is

$$HR = [PCI_t \bullet \Sigma(D_i \bullet P_{it-1}) / API_{t-1}] - \Sigma(D_i \bullet P_{it})$$

For this TRP filing, the resulting headroom is

$$HR_{R} = [PCI_{t} \bullet \Sigma(D_{iR} \bullet P_{it-1})/API_{t-1}] - \Sigma(D_{iR} \bullet P_{it})$$

$$HR_{R} = (0.555254 \bullet \$762,835,579 / 0.551520) - \$762,835,579$$

¹ To demonstrate these effects, a demonstrative TRP as well as the prior TRP (Transmittal No. 956) from which this TRP is built are attached. The actual demand for Phoenix has not been definitively identified; however, approximate demand has been developed to show the relative impacts. The data used is from these two TRPs.

$$HR_p = $5,164,684$$

Because there are no changes in prices, the revenues represented by $\Sigma(D_i \bullet P_{it})$ and $\Sigma(D_i \bullet P_{it-1})$ are equal to $\Sigma(D_{iR} \bullet P_{it})$ and the headroom can be restated to

$$HR_R = (PCI_t - API_{t-1}) \bullet \Sigma(D_{iR} \bullet P_{it}) / API_{t-1}$$

The headroom available prior to this TRP filing is

$$\begin{aligned} HR_{p} &= [PCI_{t-1} \bullet \Sigma(D_{iP} \bullet P_{it-2}) / API_{t-2})] - \Sigma(D_{iP} \bullet P_{it-1}) \\ HR_{p} &= (0.555254 \bullet \$802,409,252 / 0.551520) - \$802,409,252 \\ HR_{p} &= \$5,432,616 \end{aligned}$$

For the prior TRP filing the API is

$$\begin{aligned} & API_{t-1} = API_{t-2} \bullet \Sigma(D_{iP} \bullet P_{it-1}) / \Sigma(D_{iP} \bullet P_{it-2}) \\ & \Sigma(D_{iP} \bullet P_{it-1}) = API_{t-1} \bullet \Sigma(D_{iP} \bullet P_{it-2}) / API_{t-2} \end{aligned}$$

Using this to substitute for $\Sigma(D_{iP} \bullet P_{it-1})$ in the headroom for the prior filing gives

$$HR_{p} = [PCI_{t-1} \bullet \Sigma(D_{ip} \bullet P_{it-2}) / API_{t-2}] - [API_{t-1} \bullet \Sigma(D_{ip} \bullet P_{it-2}) / API_{t-2}]$$

$$HR_{p} = (PCI_{t-1} - API_{t-1}) \bullet \Sigma(D_{ip} \bullet P_{it-2}) / API_{t-2}$$

To determine the relationship of the headroom resulting from this TRP filing to the headroom from the prior TRP filing, the ratio of the two headrooms is determined

$$HR_{R} / HR_{P} = [(PCI_{t} - API_{t-1}) \bullet \Sigma(D_{iR} \bullet P_{it}) / API_{t-1}] / [(PCI_{t-1} - API_{t-1}) \bullet \Sigma(D_{iP} \bullet P_{it-2}) / API_{t-2}]$$

Because PCI, equals PCI, for this TRP filing, the equation can be simplified to

$$HR_{D}/HR_{D} = \left[\sum (D_{D} \bullet P_{D}) / API_{D} \right] / \left[\sum (D_{D} \bullet P_{D}) / API_{D} \right]$$

Substituting for API, from above in the head room ratio and simplifying gives

$$\begin{split} HR_R \ / \ HR_P &= \left[\Sigma (D_{iR} \bullet P_{it}) \ / \ (API_{t\cdot 2} \bullet \Sigma (D_{iP} \bullet P_{it\cdot 1}) \ / \ \Sigma (D_{iP} \bullet P_{it\cdot 2}) \right] \ / \ \left[\Sigma (D_{iP} \bullet P_{it\cdot 2}) \ / \ API_{t\cdot 2} \right] \\ HR_R \ / \ HR_P &= \left[\Sigma (D_{iR} \bullet P_{it}) \ / \ \Sigma (D_{iP} \bullet P_{it\cdot 1}) \right] \ / \ \left[\Sigma (D_{iP} \bullet P_{it\cdot 2}) \ / \ \Sigma (D_{iP} \bullet P_{it\cdot 2}) \right] \\ HR_R \ / \ HR_P &= \Sigma (D_{iR} \bullet P_{it}) \ / \ \Sigma (D_{iP} \bullet P_{it\cdot 1}) \\ \$5,164,684 \ / \ \$5,432,616 = \$762,835,579 \ / \ \$802,409,252 \\ 0.9506809 &= 0.9506814 \end{split}$$

This equation shows that the ratio of the head rooms is proportional to the head room resulting from this TRP filing to the sum of the base period demand from the prior filing multiplied by the rates from the prior filing. In other words, the headroom is reduced proportional to the reduction in revenue caused by removing the demand for the non-dominant services.

This same effect takes place in the headroom associated with the categories and sub categories. As a demonstration (without the diversion of the equations), the headroom for the DS1 sub category for this TRP filing is \$16,347,589 and the headroom from the prior filing is \$17,986,919. The ratio of these two numbers is 0.9088599. The ratio of the two respective revenues is 0.9088599 (i.e., \$247,849,713 / \$272,703,989). Again as the equality of these ratios demonstrates, the headroom is reduced proportional to the change in revenues which is all driven by the reduction in the demand. It must also be remembered that the ability to use the headroom in the sub categories is constrained by the headroom of the overreaching category. The headroom in the categories is further constrained by the headroom in the basket. Due to all of this complexity, there is little flexibility to raise prices under Price Caps and the reduction in head room caused by removing the demand further constrains that limited ability.

It is clear the headroom is automatically reduced using the Price Cap formulas. There is no windfall of headroom that can be used to raise prices for services remaining under Price Cap. The reduction in headroom reduces a LEC's ability to increase prices of less competitive services in the future. In addition, as the prices for more competitive services which are not under Price Caps (those in the Phoenix MSA, for example) are reduced, headroom is not created for other prices to be increased.

Also, there is no need for an exogenous change to be applied in the Price Cap Index formula. By the very nature of removing demand, the R value is decreased. A demonstration of the unreasonableness of an exogenous change is shown when the PCI equals the API prior to this TRP filing. In this case an exogenous change would force a decrease to the PCI. This in turn would force a decrease to the API which would force a decrease to rates. There is no justification for reducing the rates of other Price Cap services when some services are classified as non-dominant and removed from Price Cap regulation.

Nor is there a need for an exogenous adjustment to reflect the removal of costs. What costs are removed? In the case of pay phones becoming CPE, the costs of the phones were appropriately removed from the Common Line Basket; the recovery was no longer to be from the SLC or the CCLC. In the case of the sale or rural exchanges, it could be argued that the high costs of these exchanges should be removed. In the case of non-dominant treatment, no costs are being removed; the same telephone infrastructure provides the service. An argument could be developed which shows that the non-dominant services are less expensive to deliver since they are in the low cost, high density areas. If this is true, a positive exogenous cost would be appropriate to raise the rates for the services remaining under Price Caps. It suffices that any exogenous change is inappropriate.

In conclusion, the Price Cap mechanism is self-correcting. Customers of services remaining under Price Caps are adequately protected when the demand for non-dominant services is removed from the calculation of the indices.

Price Cap Glossary

API	Actual Price Index
$\mathbf{D_i}$	Demand quantities
GDP-PI	Inflation factor
HR	Headroom is the difference between the revenue generated from the actual prices and
	the revenue which is allowed if the API is equal to the PCI
HR_P	Headroom prior to removing the non-dominant demand
HR_R	Headroom when the non-dominant demand is removed
$\mathbf{P_{i}}$	Price for a rate element
PCI	Price Cap Index
R	$\Sigma(D_i \bullet P_{it-1})$ Base period revenue
t	Current time for a TRP filing
t-1	Time of the previous TRP filing
t-2	Time of the TRP filing which was prior to the previous TRP filing
TRP	Tariff Review Plan, used to demonstrate the Price Cap calculations
v	$D_i \bullet P_{it-1} / \Sigma(D_i \bullet P_{it-1})$ Estimated revenue weight, used in the API formula
w	$(R + \Delta Z)/R$ Weighting factor in the PCI formula for inflation less productivity
X	Productivity factor
ΔΥ	Imputation of Access charges
ΔΖ	Exogenous changes

Low End Adjustment

The current Price Cap regime provides for a Low End Adjustment when the actual rate of return for the base year period falls below 10.25%. This is the only practical implication of rate of return for a Price Cap company. In the unlikely event the realized rate of return would fall below 10.25% and the company chooses to seek a Low End Adjustment, the following details how that adjustment would be calculated.

The actual rate of return will continue to be reported on all interstate rate of return, Price Cap and non-dominant services. If the rate of return falls below 10.25% for a base year period and the company chooses to seek the Low End Adjustment, a PCI adjustment for the Price Cap services will be calculated by determining the earnings necessary to bring the rate of return back to 10.25% based on the reported data for the base year. See Exhibit 1 for an illustrative example.

The Low End Adjustment will be reduced by assigning some of the Adjustment to the non-dominant services. This will be accomplished by restating the non-dominant revenues to a theoretical level which reflects revenues that might have been if the non-dominant services had been priced at the corresponding Price Cap rates. The corresponding Price Caps rates are determined by calculating the actual revenue per unit (e.g., channel termination) for categories of services (e.g., DS1, DS3) for both Price Cap and non-dominant services. Exhibit 2 shows this step. The revenue for the non-dominant services is recalculated using the Price Cap revenue per unit. The difference between the realized non-dominant revenue and the theoretical revenue is used to reduce the Adjustment. See Exhibit 1.

The remaining Low End Adjustment is spread to the Price Cap and non-dominant products proportional to the realized revenues in the base year.

This process more than adequately protects the customers of Price Cap products from having to bear the entire burden if the Low End Adjustment is needed. As shown in the exhibit, only \$10.095M of the Low End Adjustment of \$20.963M is assigned to the Price Cap services. It should be noted that if the price decreases of the non-dominant services have been aggressive, much (if not all) of the Adjustment would be apportioned to the non-dominant services.

This method also shifts more of the burden of the Adjustment to the non-dominant services in another way. It is most probable that the services in the zones with the lowest prices will become non-dominant. The less competitive zones with the higher prices will remain under Price Caps. Calculating the theoretical revenues based on the average for the corresponding Price Cap services really overstates what a fair revenue per unit would have been because it uses the rates in effect for the higher priced zones.

This method for determining the Low End Adjustment more than adequately protects the customers of services remaining under Price Caps!

U S WEST High Capacity Forbearance Price Cap and Earnings Adjustments

When the FCC approves the U S WEST Communication petitions for forbearance for High Capacity Services, the changes required to the Price Cap and Earnings mechanisms are minimal. From the Price Cap perspective, the demand for the non-dominant services will be removed from the indices calculations. By removing the demand, Price Caps is self-correcting and no other Price Cap adjustments are needed. Headroom reduces proportional to the reduction in the calculated revenues, the "R" value. Exogenous changes are not needed because no costs are being removed. Customers of services remaining under Price Caps are adequately protected because the headroom is proportionally reduced and because headroom that would have been created by pricing these services to the competitive market is not available to raise Price Cap controlled prices. The Price Cap modifications to reflect the non-dominant treatment are straightforward, simple and adequate to protect customers.

In a hypothetical example run for the Phoenix MSA the headroom shrinks from \$5,432,616 to \$5,164,684 when the estimated demand for the non-dominant services is removed.

From an earnings perspective, the situation is equally straightforward. All revenues (Price Cap and non-dominant) will continue to be reported in total, the same for expenses and investment. The only practical concern for a Price Cap company is the Low End Adjustment when the realized earnings fall below 10.25%. The FCC's rules allow for an upward price change to bring the earnings back to 10.25%. If this were to happen, and an ILEC would ask for such treatment, the Low End Adjustment would be reduced by the amount of revenue the non-dominant services would have brought in if they would have been priced like similar services under Price Cap. Any remaining Adjustment is then proportionally spread to the Price Cap and non-dominant services based on the realized revenues. This method more than adequately protects the customers of Price Cap services. The company must absorb all of the Adjustment assigned to the non-dominant services. If pricing for these non-dominant services has been very aggressive, it is not impossible for all of the Adjustment to be assigned to the non-dominant side.

An example can be created where the Adjustment of \$21M results in only \$10M apportioned to the Price Cap services. The remainder of the Adjustment, \$11M, is assigned to the non-dominant services.

When granting the petition for forbearance, the Commission has the full authority to allow these changes to these procedures to take place without additional changes in its rules. Section 10 gives the Commission the necessary authority to grant this relief.

840 Proposed PCI (Exog+Unused NonExog) (with g, where appropriate)	90.9740	56.3668	55.5254	92.2160	100.0000	

NOTES:

- (1) Display indexes and factors as percent to four decimal places (e.g., display 100% as 100,000).
 (2) Display revenues as whole numbers.
 (3) Rows 650, 660, 670, 690, and 720 are computed by multiplying base period quantities by the corresponding rates at the last time the PCI was updated.
 (4) Row 630 (g factor) should be entered as zero if there are no per-minute CCL rates going into this filling.
